

STAY-PUT

Security Seat Belt Buckling System

Advantages of using the Stay-Put Security buckling system compared with any other seat belt buckle security measure.

Find us on
Facebook

1 Two seat belts in one:
The Stay-Put seat belt buckle looks and operates the same as any standard seat belt buckle that is used today when the Security system is not in operation.

2 Simple to use:
Once the driver of the vehicle has switched the dashboard module on, he/she will be able to activate/deactivate any of the security controlled buckles by pressing any of the selected buckle push buttons.

3 Accident Safety Feature:
In the event of an accident: A resettable Inertia safety cut out switch (which is an important safety feature of this system) will deactivate the security system, reverting the buckle/ buckles back to their normal seat belt buckle operation.

4 Passenger Safety:
This security system has been designed so it can never remain, or stay, in a secured position if there is no power going to the security unit. Once this happens, these seatbelts will always return to normal seatbelt operation.
